Abstract:

Information integration in computerized enterprises entails global modeling and repository systems that represent both data resources and control knowledge enterprise. Toward this end, a **metadata** system has been developed based on a stage entity-relationship approach. The system's functions include creation of models, structural models, and implementation schemata for both data and knowledge. The mappings between functional and structural models, as well as between structural models and implementation schemata, are automated. Integration of heterogeneous subsystem models across the enterprise is another function of the system. The global conceptual model of the enterprise could be used for administration purposes further mapped into physical schema for implementation. Management of the **metadata** repository is a third function. The system supports the creation, storage, management of the metadatabase as a stand-alone global information resource dictionary for all enterprise users. The creation and population of the metadatabase are fully automated according to the information model. Manipulation and query of a metadatabase are done through a **metadata** engine, which is implemented using a relational database management system coupled with a Lisp environment.
